## DICHONDRA MEDIA MOISTURE RESPONSE

Silver Falls™ and Emerald Falls Dichondra grow much faster in a dry medium (left tray) than in a wet medium (right tray). In wet media, plants not only grow slowly, but also show marginal necrosis. Dichondra plants are also sensitive to high salt, which causes leaf burn. Using low fertilizer rate of 100 to 150 ppm N once a week is recommended. In comparison with Silver Falls Dichondra, Emerald Falls is more sensitive to high salt.

## CUTTING vs. SEED

Seed-propagated plants (right plant in each picture) show excellent natural basal branching. Vegetatively propagated plants need to be pinched for branching. In the photos above, all vegetatively propagated plants received 1 pinch after transplant. Dragon Wing Begonia did not receive a pinch.
