

Plectranthus PGR Response

Silver Crest in 4.5" Pot

B9 2500ppm

Control

One to two applications of B-Nine at 2,500 to 5,000 ppm are efficient for Silver Crest shoot length control (left pot). The first application can be done 2 weeks after transplant. If necessary, repeat 2 weeks later. Avoid Cycocel and Bonzi, as Cycocel could cause phytotoxicity and Bonzi could stunt the plant.

PanAmerican Seed Culture Research

Plant height of Silver Shield Plectranthus can be controlled by 2 applications of B-Nine 2500 ppm at weeks 2 and 3 after transplanting.
