Mayan Gold Tecoma PGR Response

**B9 2500ppm/
CCC 1000ppm**

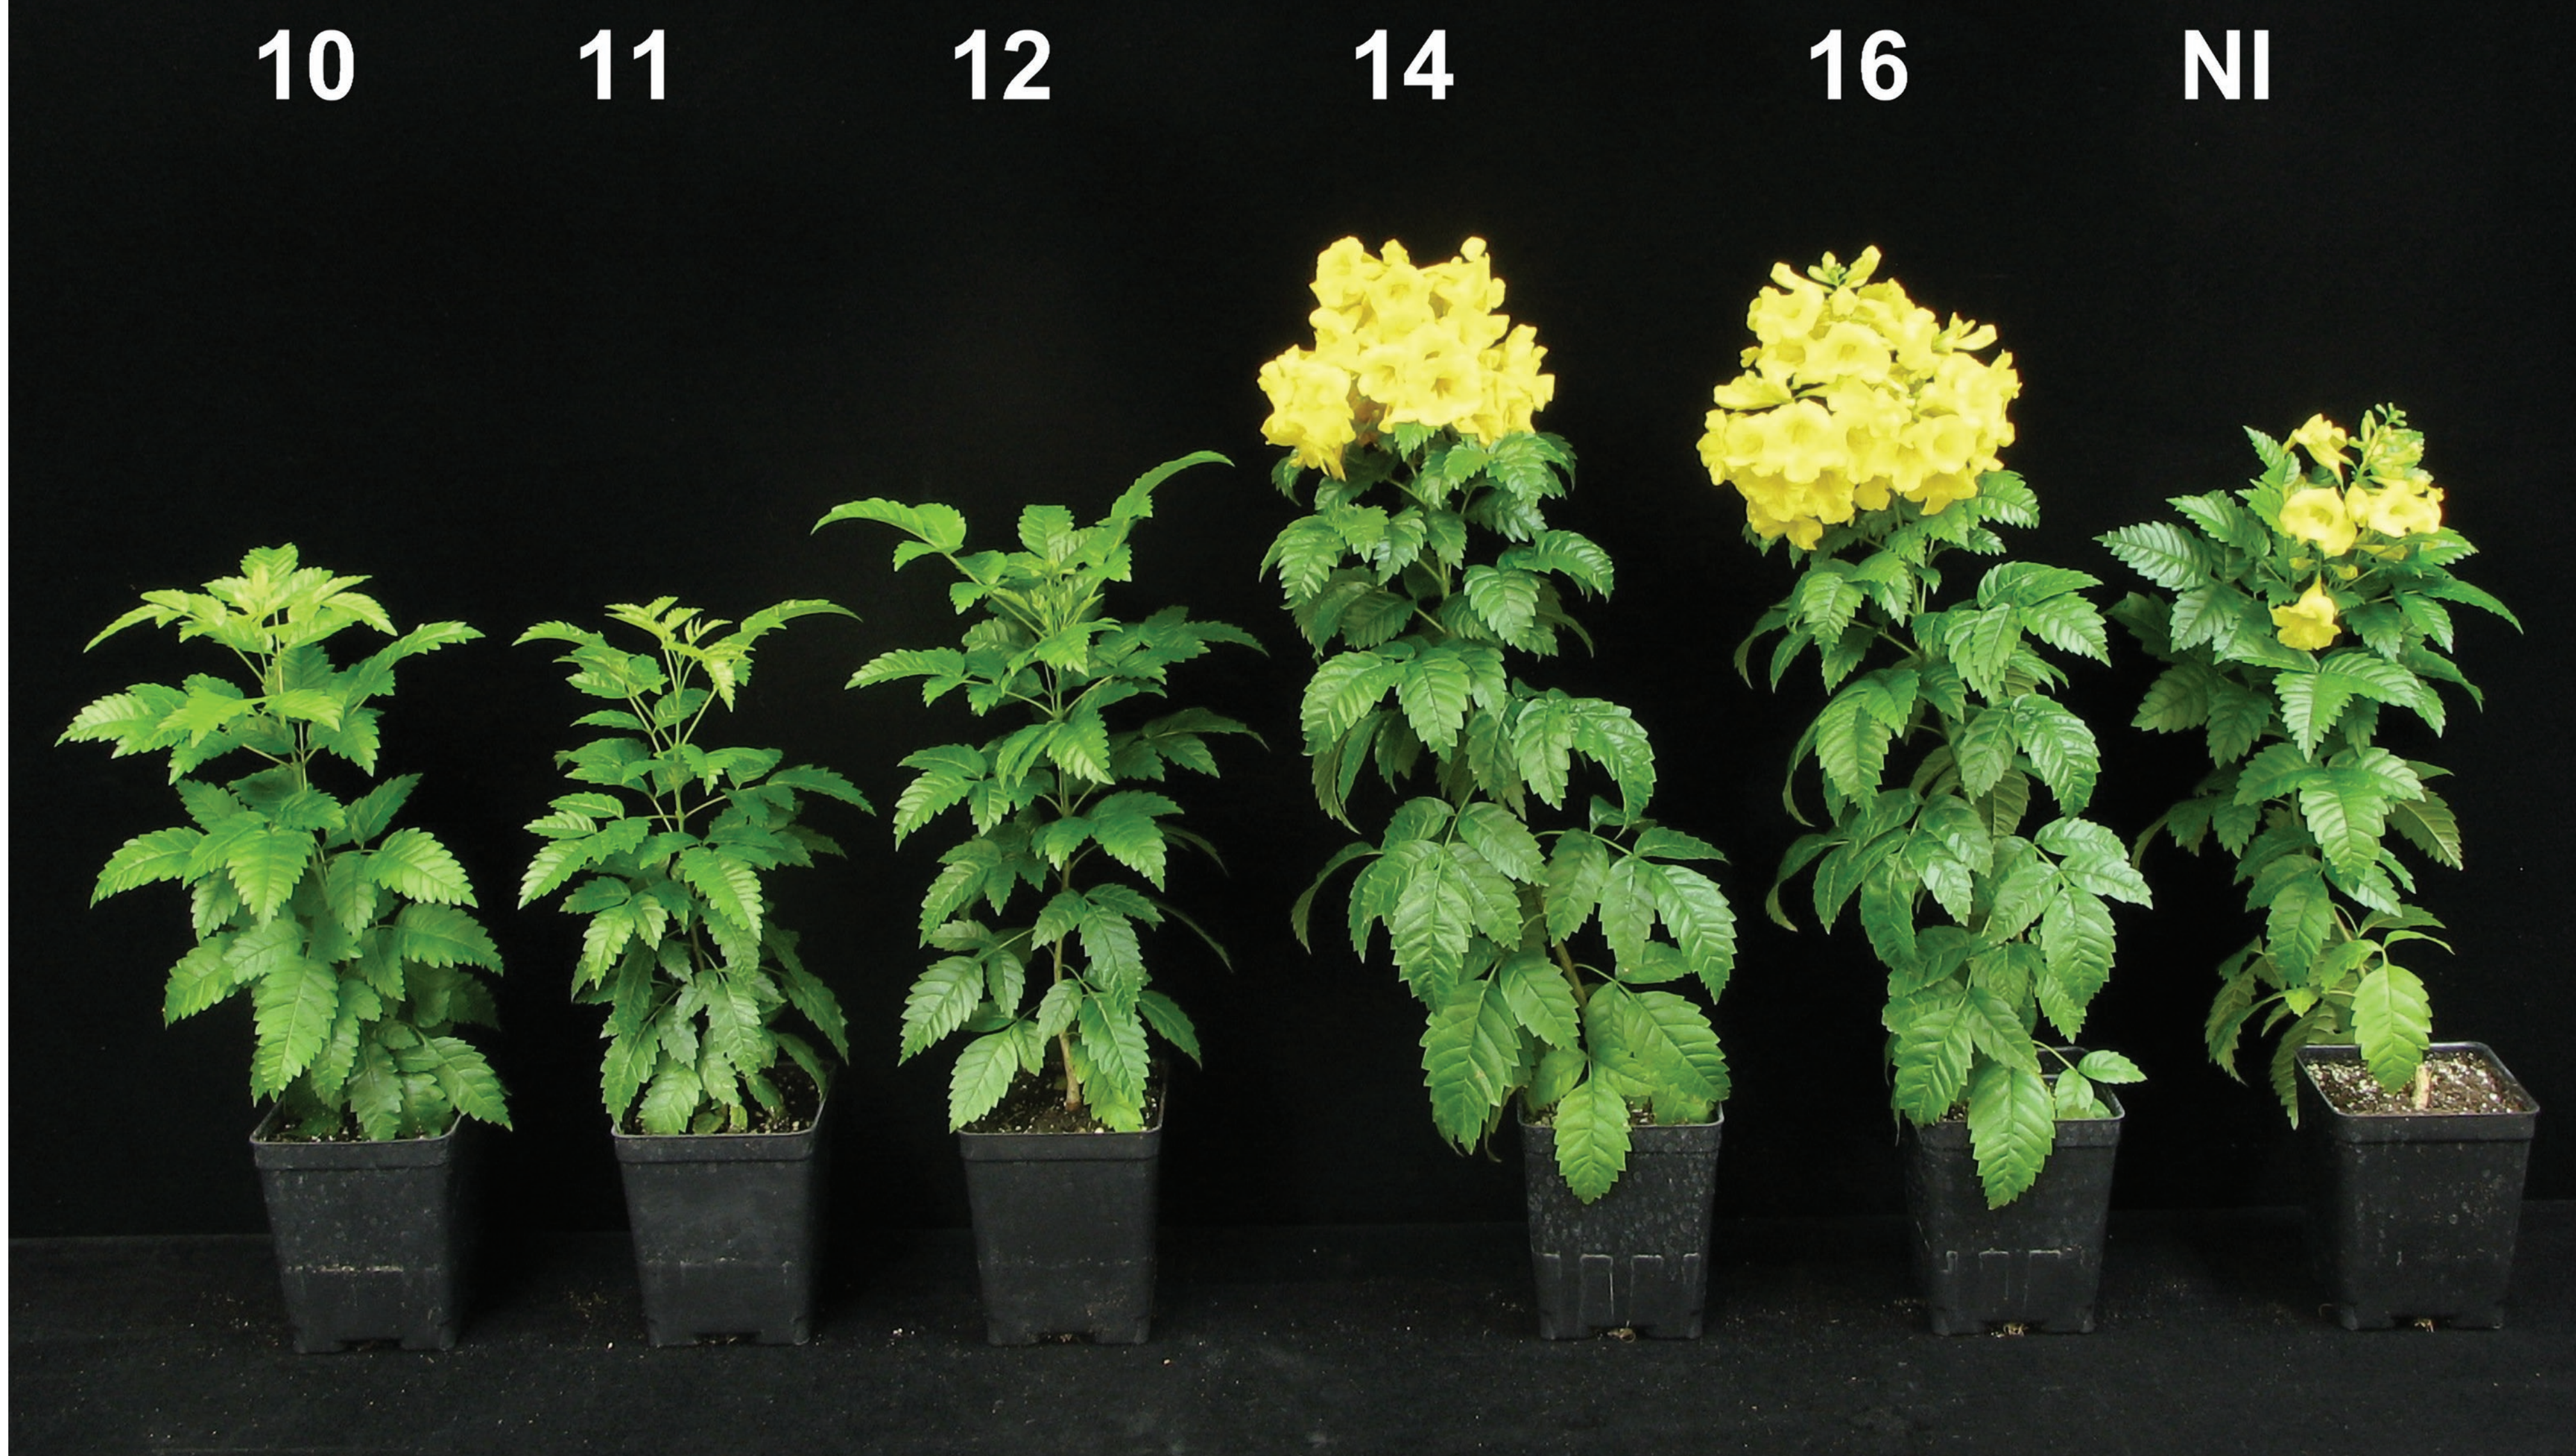

Control

Mayan Gold Tecoma responds well to a tank mix of B-Nine 2,500 ppm and Cycocel 1,000 ppm (left plant). The PGR treatment can be started 2 weeks after transplanting and repeated 2 weeks later. This treatment makes the plants more compact and stronger, but will delay flowering about 7 to 10 days.

Ball Culture Research

Mayan Gold Tecoma Photoperiod Response

Studies in the photoperiod chamber suggest Mayan Gold Tecoma is a long-day plant which flowers best with 14 hours or longer daylength. Some field observations contradict these controlled studies. Further studies will be conducted.
