

## Dakota Gold Helenium PGR Response

306 Premium Pack

B9 5000ppm

Control

When growing Dakota Gold Helenium at more than 13 hours daylength, a B-Nine spray at 5,000 ppm 2 weeks after transplanting (left plant) will control height and extend shelf life. At less than 13 hours daylength, lower rates of B-Nine or no application at all may be necessary.

# PanAmerican Seed Culture Research

## Dakota Gold Helenium Photoperiod Response

10 hours

12 hours

14 hours

Dakota Gold Helenium plants will flower regardless of daylength, but the growing habit is quite related to daylength. Plants grow slowly and less uniformly when grown under daylengths shorter than 12 hours, and become very flat or even rosette when grown under daylengths shorter than 10 hours (far left tray).
