Purple Baron and Jester Ornamental Millet can be treated the same as Purple Majesty for height control. Either a Bonzi drench or a Florel spray at about 4 weeks after sowing can be used for Millet height control and to promote branching. A Bonzi drench at 4 to 8ppm (depending on temperature) results in bushier plants (far left plants) than a Florel spray (center plants). Even at finish, plants (not shown) treated with a Bonzi drench were shorter and bushier than plants treated with a Florel spray.
