Double Zahara Zinnia PGR Response

Double Zahara Cherry and Fire zinnias respond to B-Nine sprays. B-Nine at 3,500 ppm applied twice as a foliar spray will provide good control in plant height (left plants in photos). The first application can be done 1 week after transplant, followed by a second application 7 to 10 days later.

The Effects of Environmental Conditions on Double Zahara Zinnia Flower Doubleness and Coloration

Flowers of Double Zahara Cherry and Fire zinnias tend to be less double when grown under low light or nutritional/fertilizer stress conditions. Application of a B-Nine and Cycocel tank mix PGR treatment will also reduce flower doubleness.

The flower color will be more intense (far right in photo) when grown outside under higher light with cooler temperatures (50°F/10°C nights and 60 to 70°F/15 to 21°C days).
