**GrowerFacts**

**Gazania Tetraploid Sunshine Series**

*(Gazania rigens)*  

**Plug crop time:** 4 to 5 weeks  
**Transplant to finish:** 9 to 10 weeks

- Long-blooming mix includes cream, yellow, orange, pink and red shades, with some striped flowers.  
- Upright plants are excellent for the bedding market as a landscape-performing garden plant, with larger flowers and robust growth.

### Propagation Key Tips

PGRs are generally not required for plug production. Avoid excessive salt accumulation in the plug media during plug production, as this will cause leaf tip or margin burn.

### Common Problems

Insects: Aphids, Thrips, Mites, Whiteflies  
Diseases: Damping off during seedling production
**Finishing Key Tips**

Crop time can be influenced by light levels; i.e., when grown in areas with low light levels or during period of low light intensity, crop time could be approx. 3 weeks longer. Plant Growth Regulators: If needed, use B-Nine/Alar (daminozide) at 3,500 ppm (4.2 g/l of 85% formulation or 5.6 g/l of 64% formulation) to tone the crop. One application at 2 to 3 weeks after transplant will be sufficient.

NOTE: Growers should use the information presented here as guidelines only. PanAmerican Seed recommends that growers conduct a trial of products under their own conditions. Crop times will vary depending on the climate, location, time of year, and greenhouse environmental conditions. It is the responsibility of the grower to confirm the treatment is available in their region as well as read and follow all the current label directions relating to the products.
